Problem has been graded.

You are given a capacitor with a capacitance  $C_1$ . At time t=0, the voltage across this capacitor is  $V_o$ .

If a constant current  $I_1$  flows through the capacitor, how long will the capacitor take to charge up to a charge of 10 nC?

#### Given Variables:

C1:8 nF

Vo : 1 V

11:2 mA

Calculate the following:

t (us):

You are given a capacitor with a capacitance  $C_1$ . At time t=0, the voltage across this capacitor is  $V_0$ .

C1 = 2 nF

Vo = 3 V

If a constant current  $I_1$  flows through the capacitor, how long will the capacitor take to charge up to a charge of 10 nC?

11 = 2 mA

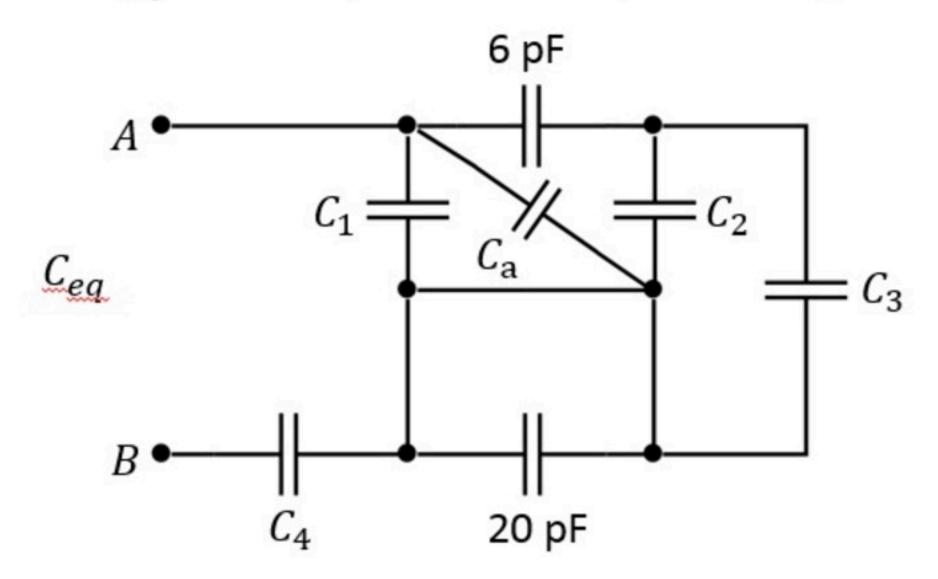

$$V_{end} = 3V$$
  $Q = C.V$ 

$$V_{end} = \frac{Q_{end}}{C_1} = \frac{10 \cdot 10^{-9}}{2 \cdot 10^{-9}} = 5V$$

$$V_{eno} = V_c + \frac{1}{C} \int_{c_o}^{E} I, \delta t = V_c + \frac{I}{C} \cdot E$$

$$E = (V_{eNO} - V_0) \cdot \frac{C}{I_1} = (5-3) \cdot \frac{2 \cdot 10^{-9}}{2 \cdot 10^{-3}}$$

Given  $C_{eq}$  between points A and B, what is  $C_a$ ?

#### Given Variables:

C1:2 pF

C2:2pF

C3:4 pF

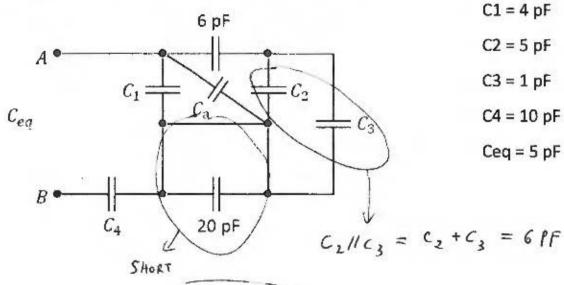

C4:6 pF

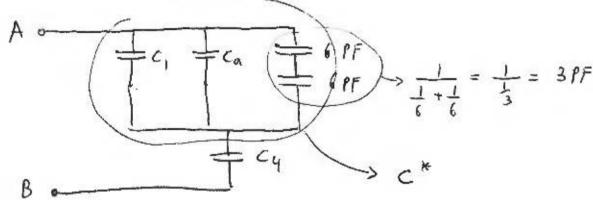

Ceq:3 pF

Calculate the following:

Ca (pF):

Given  $C_{eq}$  between points A and B, what is  $C_a$ ?

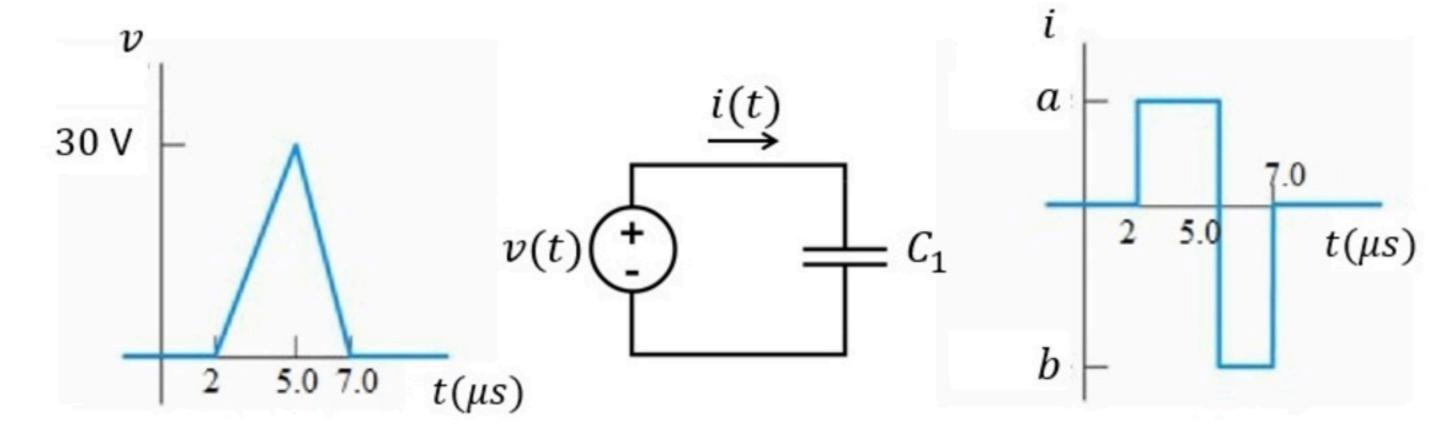

$$\frac{1}{C_{eq}} = \frac{1}{C_{ij}} + \frac{1}{C^*} \Rightarrow \frac{1}{C^*} = \frac{1}{5} - \frac{1}{10} = \frac{1}{10} \Rightarrow C^* = 10 \text{ pf}$$

$$C^* = C_1 + C_0 + 3 \Rightarrow C_0 = 10 - 4 - 3 = 3 PF$$

$$\boxed{C_0 = 3 PF}$$

Problem has been graded.

Given the two plots of the voltage and current of the capacitor. Find the values of a and b labeled on the graph.

Given Variables:

C1:8 nF

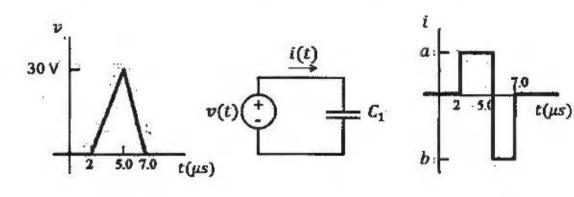

Calculate the following:

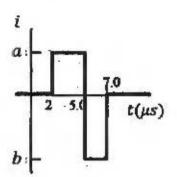

a (A):

0.08

b (A):

-0.12

$$\frac{d\sigma}{dt} = \frac{\Delta \sigma}{\Delta t} = \frac{30 V}{3.10^{-6} R}$$

$$L = 10^{-3} \cdot \frac{30}{3 \cdot 10^{-6}} = 10 \cdot 10^{-3} = 0.01$$

$$\frac{dv}{dt} = \frac{\Delta v}{\Delta t} = \frac{-30V}{2.10^{-6} \text{ A}}$$

$$\bar{\ell} = 10^{-3} \frac{(-30)}{2.10^{-6}} = -15.10^{-3} = -0.015$$

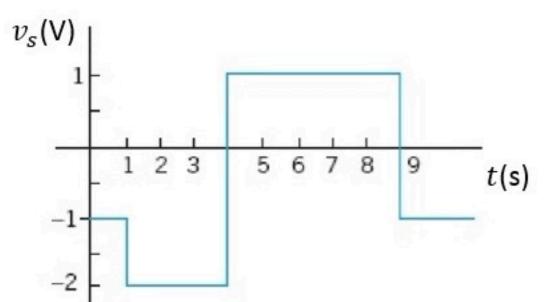

Find the current i(t) in the circuit, when i(0) = 1 A and the voltage is as shown in the graph.

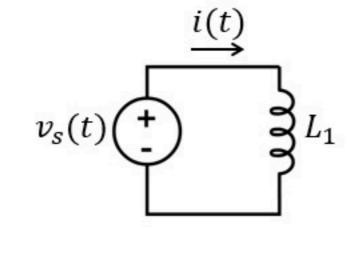

$$i(t) = a_3 t + a_4$$
 for 1 s < t < 4 s

$$i(t) = a_5 t + a_6$$
 for  $4 s < t < 9 s$ 

$$i(t) = a_7 t + a_8$$
 for 9 s < t

Given Variables:

L1:0.2 H

Calculate the following:

a1 (A/s):

a3 (A/s):

-10

a4 (A):

a5 (A/s):

a6 (A):

-54

a7 (A/s):

a8 (A):

36

Find the current i(t) in the circuit, when i(0) = 1 A and the voltage is as shown in the graph.

L1 = 0.1 H

 $(a) \quad i(t) = a_1 t + a_2$ 

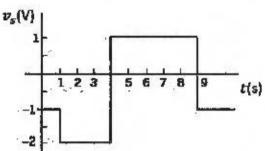

for 
$$0 \le t \le 1 \le$$

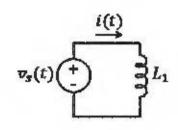

$$\sigma_{x} = L \frac{di}{dt}$$

$$(b) \quad i(t) = a_3t + a_4$$

$$(i(t) = a_5t + a_6$$

$$0 \quad i(t) = a_7 t + a_8$$

(a) 
$$t_0 = 0 P$$
 :  $\hat{L}(b) = 1 + \frac{1}{6.1} \int_{0}^{b} (-1) du = 1 - 10 b$ 

$$a_1 = 1 A$$

(1) 
$$E_0 = 15$$
  $E(E) = -9 + \frac{1}{0.1} \int_{1}^{E} (-2) du = -9 - 20(E-1) = 11 - 20E$ 

where  $E = 45$   $E(4) = 11 - 20.4 = -69A$ 
 $E(4) = 11 - 20.4 = -69A$ 
 $E(4) = 11 - 20.4 = -69A$ 

€ 
$$E_0 = 4n$$
.  $\hat{c}(t) = -69 + \frac{1}{0.1} \int_{4}^{6} 1 du = -69 + 10(t-4) = -109 + 10t$   
of  $t = 9n$ .  $\hat{c}(t) = -109 + 10.9 = -13A$ 

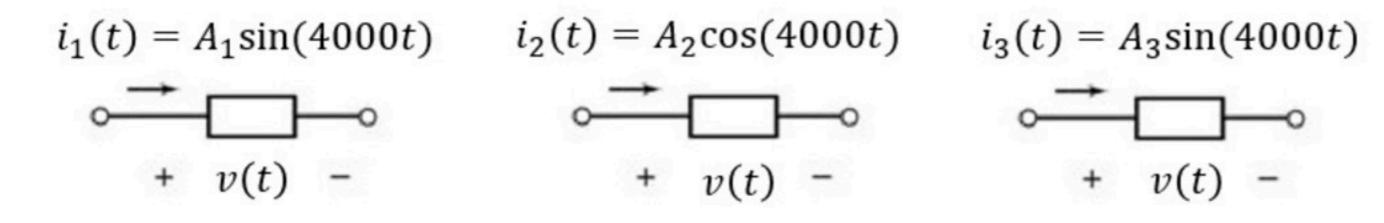

$$\frac{d_5 = 10 \text{ M}_0}{06 = -109 \text{ A}}$$

(1) 
$$E_0 = 30$$
.  $i(16) = -19 + \frac{1}{0.1} \int_{0.1}^{E} (-1) du = -19 \cdot i0(E-5) = 71 - 10E$ 

$$a_7 = 40 \frac{1}{2} \int_{0.1}^{E} a_8 = 71 A$$

One of these three elements is a resistor, one is an inductor, and one is a capacitor, but you are not told in advance which one is which. You are given the voltages across and the currents through each one of the elements.

$$v(t) = 12\cos(4000t) \text{ V}$$

Find the value of the resistor R, the inductor L and the capacitor C (all three are positive values).

(For this problem, ignore the initial conditions. As we will see later in this course, this means we assume the system is in what is called "steady state".)

Given Variables:

A1:-48 mA A2:6 mA A3:3 mA

Calculate the following:

R (kohm):

2

L (H):

1

C (uF):

1

One of these three elements is a resistor, one is an inductor, and one is a capacitor, but you are not told in advance which one is which. You are given the voltages across and the currents through each one of the elements.

$$A1 = -96 \text{ mA}$$

$$A2 = 12 \text{ mA}$$

$$A3 = 3 mA$$

$$v(t) = 12\cos(4000t) \text{ V}$$

$$i_1(t) = A_1 \sin(4000t)$$
  $i_2(t) = A_2 \cos(4000t)$   $i_3(t) = A_3 \sin(4000t)$ 
 $t_2(t) = A_2 \cos(4000t)$   $t_3(t) = A_3 \sin(4000t)$ 
 $t_2(t) = A_2 \cos(4000t)$   $t_3(t) = A_3 \sin(4000t)$ 

Find the value of the resistor R, the inductor L and the capacitor C (all three are positive values).

(For this problem, ignore the initial conditions. As we will see later in this course, this means we assume the system is in what is called "steady state".)

$$\Re$$
 INDUCTOR:  $U = L \frac{dC}{dt} \Rightarrow C = \frac{1}{L} \int U dt = \frac{12}{L} \cdot \frac{\operatorname{pin}(4000t)}{4000}$  (

$$\otimes$$
 RESISTOR:  $V = iR \Rightarrow i = \frac{12}{R} con(40006)$  (3)

$$\otimes$$
 ONLY  $i_2$  is  $\omega_7(4000E) \Rightarrow FROM(3)$ .  $\frac{12}{R} = A_2 = 12.10^{-3}$ 

$$R = 10^3 \Omega \qquad \boxed{R = 1 \text{ kg}}$$

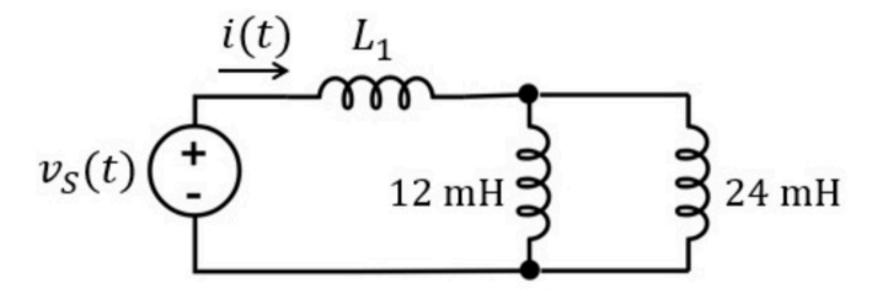

$$\&$$
 CAPACITOR HAS - SIGN FOR CURRENT  
=> FROM (1) . - C.12. 4000 = A<sub>1</sub> = -36 10<sup>-3</sup>  
 $C = 2.10^{-6}$   $C = 2.16$ 

(8) INDUCTOR HAS + SIGN FOR CURRENT

$$\Rightarrow FRom (2): \frac{12}{4000L} = A_3 = 3.10^{-3} \Rightarrow \left[L = 1 \text{ H}\right]$$

#### Find the current i (i.e., the constant B).

(For this problem, ignore the initial conditions. As we will see later in this course, this means we assume the system is in what is called "steady state".)

$$v_S(t) = A \cdot \cos(2000t)$$

$$i(t) = B \cdot \sin(2000t)$$

Given Variables:

A:8 V L1:2 mH

Calculate the following:

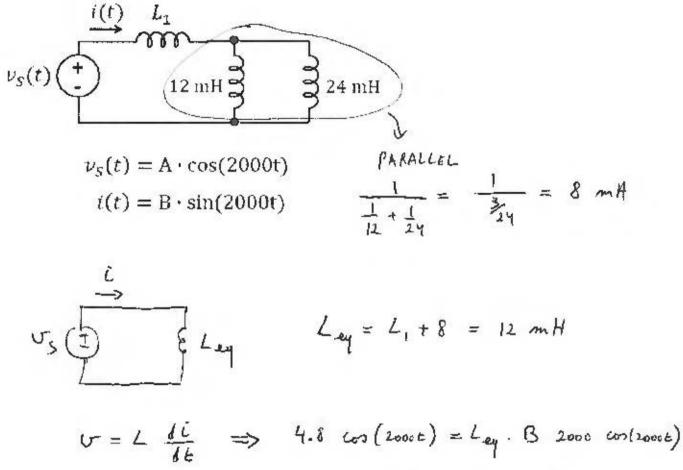

B (mA):

400

#### Find the current i (i.e., the constant B).

A = 4.8 V L1 = 4 mH

(For this problem, ignore the initial conditions. As we will see later in this course, this means we assume the system is in what is called "steady state".)

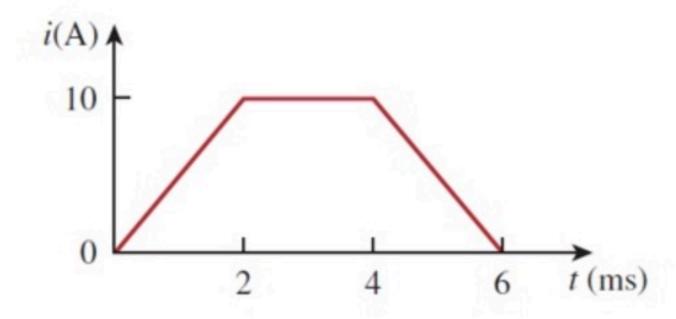

$$\Rightarrow B = \frac{4.8}{2000.12.10^{-3}} = \frac{4.8}{24} = 0.1 \text{ A}$$

Unlimited Attempts.

Below is the current through a 5 µH inductor.

What is the voltage  $v_1$  across the inductor at time t = 3 ms?

What is the voltage  $v_2$  across the inductor at time t = 5 ms?

Given Variables:

. : . .

Calculate the following:

v1 (V):

0

v2 (V):

-0.025

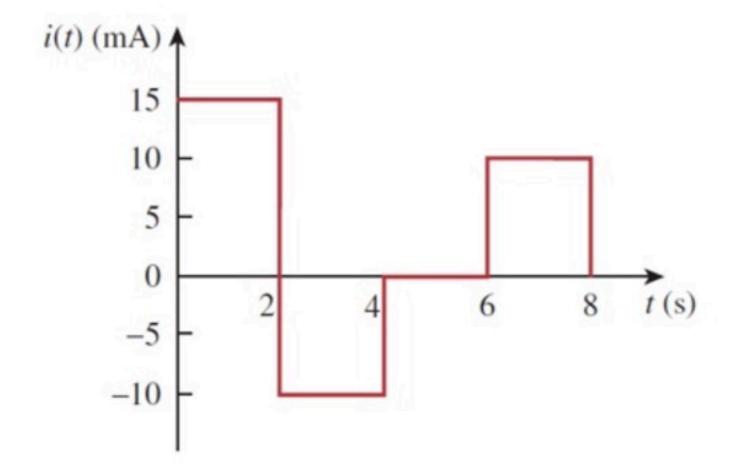

Hint: Check the units.

Unlimited Attempts.

Below is the current through a 400  $\mu$ F capacitor. The voltage across the capacitor at time t = 0 is 5 V.

What is the voltage  $v_1$  across the capacitor at time t = 3 s?

What is the voltage  $v_2$  across the capacitor at time t = 8 s?

Given Variables:

. : . .

Calculate the following:

v1 (V):

55

v2 (V):

80

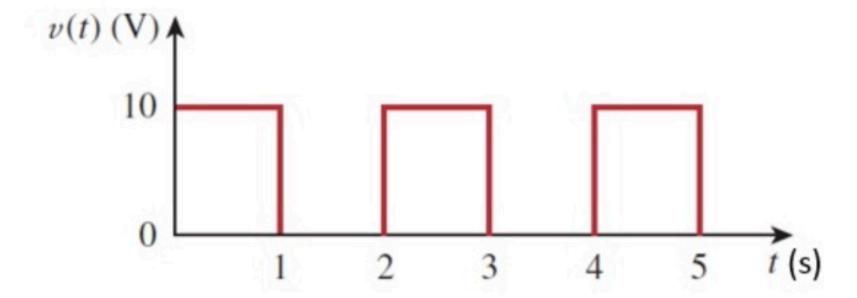

Hint: Check the units.

Unlimited Attempts.

Below is the voltage across a 4 H inductor. The current through the inductor at time t = 1 s is -1 A.

What is the current  $i_1$  through the inductor at time t = 3 s?

What is the current  $i_2$  through the inductor at time t = 4.5 s?

Given Variables:

. : . .

Calculate the following:

i1 (A):

1.5

i2 (A):

Unlimited Attempts.

The current through a 400 nF capacitor is  $0.05e^{-2\,\mu s}$  A. The voltage across the capacitor at time t = 0 is 1 V.

What is the voltage v across the capacitor at time  $t = \infty$ ?

Given Variables:

. : . .

Calculate the following:

v (V):

Unlimited Attempts.

The current through a 20 mH inductor is  $0.04te^{-\frac{\iota}{2\,\mu s}}$  A.

What is the voltage  $v_1$  across the inductor at time t = 0?

Given Variables:

. : . .

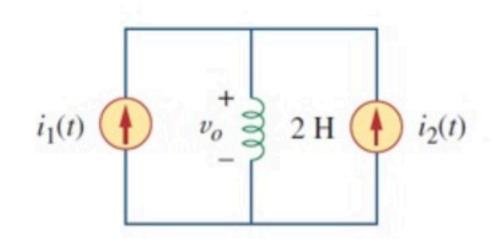

Calculate the following:

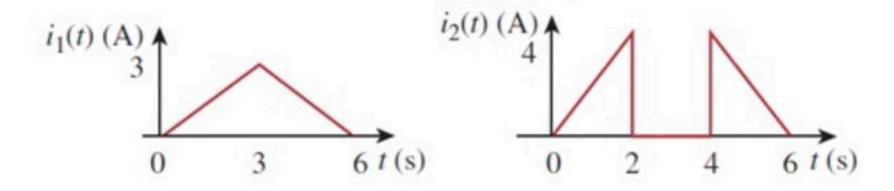

v1 (mV):

Unlimited Attempts.

What is the voltage  $v_o$  at time t = 5 s?

Given Variables:

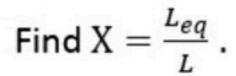

. : . .

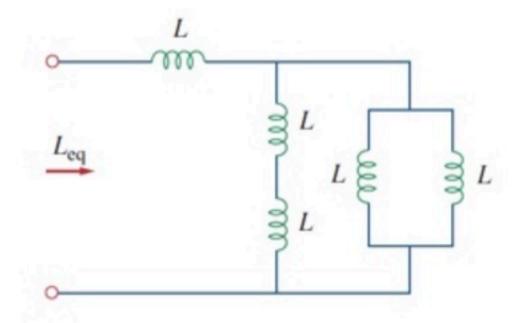

Calculate the following:

vo (V):

-6
